General Information

Practicalities, curiosities, etc.

giovanni.squillero@polito.it Computational Intelligence

3

Why Telegram?

- Not really private
 - E2EE not available in group chats
 - Closed source
 - Centralized infrastructure
 - Known to log IPs and other sensitive info
- Reasonably widespread among students
- Protects users against other group members
- Do not expose phone numbers

giovanni.squillero@polito.it Computational Intelligence

5

2024-25

6

Syllabus

- Searching for...
 - a single state (in discrete and continuous spaces)
 - a sequence of actions (a.k.a., a path)
 - a formula (numeric, logic)
 - a policy (what to do in a given state)
 - a program (what to do, in general)
- Evolutionary Algorithms
- Multi-agent Systems
- Information representation

giovanni.squillero@polito.it Computational Intelligence

2024-25

7

Lectures

Week	28	29	30	31	1

11

Practicalities

giovanni.squillero@polito.it Computational Intelligence

8

Labs

- 60h = 42 + 18 (roughly)
- No hard distinction between lectures and labs
- Bring your own laptop (or a friend with a laptop)
 - We will try to support online students
- Work in groups, help colleagues, and get help
- Ubuntu: A person is a person through other people

giovanni.squillero@polito.it Computational Intelligence

Cool Books

- S. Luke; "Essentials of Metaheuristics" (2nd edition) — freely available online
- A. E. Eiben, J. E. Smith; "Introduction to Evolutionary Computing" (2nd edition)
- M. Mitchell; "Artificial Intelligence: A Guide for Thinking Humans"
- S. Russell, P. Norvig; "Artificial Intelligence: A Modern Approach" (4th edition)

govemr.sqatters@polito.it

Computational Intelligence

13

Rules of Engagement

No chatting/texting during lectures

- You have 1 linguistic processor in your brain
- No mobiles
- Laptop in Zen mode
- You could exercise or play chess (if you are a professional), thou
- Please, don't waste your time

govemr.sqatters@polito.it

Computational Intelligence

15

Rules of Engagement

Lectures are required but not sufficient

- Roughly 10h of lecture requires 15h of study (see "The academic credit system" in the *Student Guide*)
- Your duties:
 - Take notes (slides are not self contained)
 - Broaden the subjects
 - Run code and do experiment on your boxes (i.e., change stuff and see what happens)

govemr.sqatters@polito.it

Computational Intelligence

17

Rules of Engagement

Rule 0: Don't cheat

- Solve together, submit alone
- Declare any help received and provide refs, e.g.
 - "I worked with Alice"
 - "I copied the procedure from Bob's repo"
 - "I found this idea on Stack Overflow"

govemr.sqatters@polito.it

Computational Intelligence

14

Rules of Engagement

Max lag is 24h

- To meet coursework deadlines, students that cannot attend in presence are required to participate online or to watch the recorded lecture within 24h
- After 1 day I can assume that everything said in class is known (without the need to write it)
- Caveat: Recorded lectures are not a valid substitute for in-person attendance

govemr.sqatters@polito.it

Computational Intelligence

16

Rules of Engagement

Face to face and Online behavior

- Limit the discussions to the course topics
- Show courtesy
- Respect different viewpoints and experiences
- Accept criticisms
- Have a fair share of sense of humor

govemr.sqatters@polito.it

Computational Intelligence

18

7

8

9

Rules of Engagement

Questions

Dilbert.com @BoudkhalSays

govemr.sqatters@polito.it

Computational Intelligence

19

Why GitHub?

- De facto standard for version control and collaborative software development
- Large user base
- Strong brand recognition
 - Your future employers are likely to peek into your repos (be prepared!)
- Free (as in free beer, not free speech)

govemr.sqatters@polito.it

Computational Intelligence

21

Exam

Timely participation: up to 6 points

- Post labs solution on GitHub before deadline
 - Note 1: all labs will be evaluated, including **Lab 0**
 - Note 2: failure to report your handle in the shared sheet or to name the directories correctly will result in no points being awarded in the exam
- Review peers' solutions on GitHub before deadline (note: We judge the **reviewer** based on their reviews, and we judge the **reviewed** based on how they implement peers' reviews)
- Voluntarily present sharp ideas in class

govemr.sqatters@polito.it

Computational Intelligence

23

Exam

A GitHub repo is required

- GitHub will be used to certify submission times and for peer-review activities
- Register on GitHub, fill your info in the CryptPad shared sheet on http://tiny.cc/ci24_github
- Upload solution to Lab N in a repo named **CI2024_labN**
- Note: These instructions will not be repeated

govemr.sqatters@polito.it

Computational Intelligence

20

Why CryptPad?

- Open source, free, private (self-claimed)
 - Note: You should not trust any web-based service to do what it claims to do
- No Google account, no email marketing
- Anonymous access through Tor
- Note: I'm using TinyCC's short links

govemr.sqatters@polito.it

Computational Intelligence

22

Lab 0

- List your handle in http://tiny.cc/ci24_github
- Create a public repo named **CI2024_lab0**
- Upload a file named **irony.md** containing a joke, a pun, or a witty remark about the 1st lecture

DEADLINE: Wednesday, September 25 @ 14:00 UTC

24

Exam

Project Work: up to 12 points

- The project work is mandatory
- Students are encouraged to work in teams, but each student is individually responsible for the entire assignment
- The Project Work(s) will be assigned later

govanni.squitteri@polito.it

Computational Intelligence

25

25

Exam

Oral Exam: an offset up to +/-99 points

- An oral exam may be required by the instructor (not by the student)
- Failure to attend will result in failure of the entire exam

govanni.squitteri@polito.it

Computational Intelligence

27

27

Exam

Caveat

- Everything said in classroom is an integral part of the course and can be checked during the exam
- ... including introductions, examples, notes, etc.

govanni.squitteri@polito.it

Computational Intelligence

29

29

Exam

Written Exam: up to 14 points

- The written exam is mandatory
- Computer-based written test using POLITO platform
- Open-ended questions covering all topics of the course and the project work
- Note: due to Politecnico's policies, students will need a laptop with a working LockDown browser (test it and report any problem in advance!)

govanni.squitteri@polito.it

Computational Intelligence

26

26

Exam

The PDF report

- The report is mandatory
- At least **168h** (i.e., 1 week) before the official exam date/time students must submit a PDF report detailing all their activities during the course (log like)
- The report is valid for 2024/25 only
- The report must be resubmitted if a student decide to retake the exam (sorry, but it's easier for us)
- Tip: write in Markdown (also with CryptPad), and generate PDF with Pandoc

govanni.squitteri@polito.it

36

18

Artificial Intelligence

giovanni.squitteri@polito.it

Computational Intelligence

37

37

Complexity and Intelligence

- **Complex $\neq$ Intelligent**
- The Game of Life, John Horton Conway (1970)
 - Repeated applications of **simple rules may lead to unforeseeable results**
- Complex properties arise from simple laws

giovanni.squitteri@polito.it

Computational Intelligence

39

Generalization and Intelligence

- Local generalization
 - A.k.a., robustness
- Adaptation to known unknowns within a single task or well-defined set of tasks
- E.g., Image classifiers (almost working)

giovanni.squitteri@polito.it

Computational Intelligence

41

41

Pop Quiz

- How many countries are crossed by the equator line in Africa? Shout the answer!!!
- Understand the problem (text)
- Invent an algorithm
- Change domain (visual)
- Look up a map
- Execute the algorithm
- Change domain (speak)

giovanni.squitteri@polito.it

Computational Intelligence

38

38

19

Generalization and Intelligence

- Intelligence measures an agent's ability to achieve goals in a wide range of environments
- AI is the science and engineering of making machines do tasks they have never seen and have not been prepared for beforehand

giovanni.squitteri@polito.it

Computational Intelligence

40

40

20

Generalization and Intelligence

- Broad generalization
 - A.k.a., flexibility
- Adaptation to unknown unknowns across a broad category of related tasks
- E.g., self-driving cars (still sci-fi)

giovanni.squitteri@polito.it

Computational Intelligence

42

42

21

9/23/24

9/23/24

9/23/24

Generalization and Intelligence

- Extreme generalization
 - AGI
- **Adaptation to unknown unknowns across an unknown range of tasks and domain**
- ROFL (Roll On Floor Laughing)
- Not even at the horizon

→ AI che si adatta

giovanni.squitteri@polito.it

Computational Intelligence

Ada Countess of Lovelace

- London, 1815-1852
- Only child of Lord Byron
- First programmer in history

1842

The "computer" has no pretensions whatever to originate anything. It can do whatever we know how to order it to perform. It can follow analysis; but it has no power of anticipating any analytical relations or truths. Its province is to assist us in making available what we are already acquainted with...

government@polito.it Computational Intelligence 60

30

Computational Intelligence

- Multi-agent Systems
- Norvig's rational agents
- "Computational Intelligence is the study of the design of intelligent agents" (Poole et al., 1998)

giovanni.squitteri@polito.it

Computational Intelligence

61

61

Computational Intelligence

- Learning is more "guess n' check"
 - *There is an obvious connection between the learning process and evolution (Alan Turing)*
- Optimization can be "trial n' error"
 - Possibly smarter than brute force's "try all"
 - Oversimplification may lead to approximate results
- Problems are solved by searching
- Solutions are built incrementally

giovanni.squitteri@polito.it

Computational Intelligence

63

63

65

Common Narratives

- Learning is Optimization
 - I.e., maximize quality over the train set in ML
- Optimization is Gradient Descent
 - I.e., maximize quality is minimize loss in NN

giovanni.squitteri@polito.it

Computational Intelligence

62

62

2

The Six Students Problem

- Six students (three from computer engineering, three from data science and engineering) spent the afternoon studying Computational Intelligence

4

• participants : 6 $\left\{ \begin{array}{l} 3 \text{ computer engineers (C)} \\ 3 \text{ data scientists (D)} \end{array} \right.$

9/25/24

2

9/25/24

The Six Students Problem

- In the evening, they decide to go out for pizza together at Pixel Pizza, but the place is not within walking distance
- Fortunately, one of the students has a tandem bicycle that can transport two people
- How will they get there?

5

7

Problem!

- If there are more computer engineers (C) than data scientists (D) in a group of students, the C's will start talking about post-quantum cryptography, the D's will lose interest, and the evening will be ruined

6

Modeling

- Abstraction
 - Simplifying the problem by focusing on its key elements and ignoring irrelevant details
- Representation
 - Expressing the problem in a formal language or framework

8

Modeling

- Possible terminology
 - Problem space (a.k.a., the real world) Bob, Carl, ...
 - State space (a.k.a., the result of modeling) CCC BBB
 - Solution space (a.k.a., viable states from state space)
- Note: Some scholars adopt different terms

giovanni.squillero@polito.it Computational Intelligence 9

9

Abstraction

- A “state” in the “problem space” contains all and only the relevant information.
(friends at home, friends in pizzeria)

giovanni.squillero@polito.it Computational Intelligence 11

11

Modeling

- Abstraction
 - Simplifying the problem by focusing on its key elements and ignoring irrelevant details
- Representation
 - Expressing the problem in a formal language or framework
- Simplification
 - Making assumptions or approximations to make the problem more tractable

giovanni.squillero@polito.it Computational Intelligence 10

10

Representation

- Some state are invalid
(CCDDDD, .) → kiti a casa
(CC, CDDD)
~~(DD, CCDD)~~
- A good representation exposes the constraints
count(C) <= count(D)

giovanni.squillero@polito.it Computational Intelligence 12

12

5

6

Representation

- Two states are connected if they differ for the position of 2 students (a trip in tandem)
- Solution: find the shortest path
(CCDDDD, .) ⇒ (., CCCDDDD)

giovanni.squillero@polito.it Computational Intelligence 13

13

Solution?

no, because there isn't the tandem

(CCDDDD, .)
↓
(CCDD, CD)
↓
(CD, CCDD)
↓
(., CCCDDDD)

??

giovanni.squillero@polito.it Computational Intelligence 15

15

Solution

(CCDDDD, .)
↓
(CCDD, CD)
↓
(CD, CCDD)
↓
(., CCCDDDD)

giovanni.squillero@polito.it Computational Intelligence 14

14

giovanni.squillero@polito.it Computational Intelligence 16

16

7

8

Representation

- **Correct representation**
(friends at home, friends in pizzeria, position of the tandem)

giovanni.squillero@polito.it Computational Intelligence 17

17

Representation

- **Correct representation**
(friends at home, friends in pizzeria, position of the tandem)
- **Correct constraints**
 $\text{count}(C) \leq \text{count}(D)$ or $\text{count}(D) == 0$
- **Solution: find the shortest path**
 $(\text{CCCD}\text{DD}^*, \cdot) \Rightarrow (\cdot, \text{CCCD}\text{DD}^*)$

giovanni.squillero@polito.it Computational Intelligence 19

19

Representation

- **Correct representation**
(friends at home, friends in pizzeria, position of the tandem)
- **Correct constraints**
 $\text{count}(C) \leq \text{count}(D)$ or $\text{count}(D) == 0$

giovanni.squillero@polito.it Computational Intelligence 18

18

States

giovanni.squillero@polito.it Computational Intelligence 20

20

9

10

Valid states (Solution space)

giovanni.squillero@polito.it Computational Intelligence 21

21

Solution: 11 steps

$\text{CCCD}\text{DD}^* \cdot \Rightarrow$
 $\text{CDDD}-\text{CC}^* \Rightarrow \text{CCDD}^*-\text{C} \Rightarrow$
 $\text{DDD}-\text{CCC}^* \Rightarrow \text{CDDD}^*-\text{CC} \Rightarrow \text{CD}-\text{CCDD}^* \Rightarrow$
 $\text{CCDD}^*-\text{CD} \Rightarrow \text{CC}-\text{CDDD}^* \Rightarrow \text{CCC}^*-\text{DDD} \Rightarrow$
 $\text{C}-\text{CCDD}^* \Rightarrow \text{CD}^*-\text{CCDD} \Rightarrow$
 $-\text{CCCD}\text{DD}^*$

giovanni.squillero@polito.it Computational Intelligence 23

23

Paths in the solution space

giovanni.squillero@polito.it Computational Intelligence 22

22

What did we learn?

giovanni.squillero@polito.it Computational Intelligence 24

24

Modeling

- Find key elements (ignore irrelevant details)
- Formalize the problem (expose constraints)

The greatest challenge to any thinker is stating the problem in a way that will allow a solution

— Bertrand Russel (1872-1970)

giovanni.aquillaro@polito.it

Computational Intelligence

25

Solving

- Incrementally building a solution
 - Not necessarily starting from the beginning
- Improving an existing solution
 - This "solution" may not be feasible
- Trial and error
- Guess and check
- Generate and test (brute force)
- Learning?

giovanni.aquillaro@polito.it

Computational Intelligence

27

Modeling

- Find key elements (ignore irrelevant details)
- Formalize the problem (expose constraints)
- Make assumptions to make the problem tractable
- Approximate to reduce complexity

Everything should be as simple as possible but not simpler

— Albert Einstein (1879-1955)

giovanni.aquillaro@polito.it

Computational Intelligence

26

Find the formula for the number of steps needed to bring a generic group of $n_C + n_D$ students to the pizzeria.

Motivate the answer.

Bonus problem!
+2 at the exam

2

NP Problems

- Nondeterministic Polynomial time problems
 - Verifiable in polynomial time *respect to the input dim*
 - Infamous P vs. NP, NP vs. co-NP dilemmas
- NP-Hard, NP-Complete
- Space/Time complexity
- Practical definition:
 - You can only test a small fraction of the input space

giovanni.squillero@polito.it Computational Intelligence 4

4

Il Dilemma:
La domanda centrale è: $P = NP$?

- Se $P = NP$: Significherebbe che ogni problema per cui possiamo verificare una soluzione rapidamente può anche essere risolto rapidamente. Questo avrebbe enormi implicazioni in campi come la crittografia, l'ottimizzazione e la teoria dei giochi.
- Se $P \neq NP$: Indicherebbe che esistono problemi la cui soluzione può essere verificata rapidamente, ma non necessariamente trovata rapidamente.

NP vs. co-NP:

- **co-NP**: Comprende i problemi i cui **complimenti** (le risposte negative) appartengono a NP.
- **Il Dilemma**: È ancora aperto se NP è uguale a co-NP. Se $NP \neq co-NP$, ci sarebbero problemi i cui complimenti non possono essere verificati rapidamente, aggiungendo un ulteriore livello di complessità.

NP-Hard:

- Questi sono problemi che sono **almeno** difficili quanto i problemi più difficili in NP. Non devono necessariamente appartenere a NP (cioè, non è richiesto che le loro soluzioni possano essere verificate in tempo polinomiale).
- **Esempio**: Il Problema del Viaggiatore (TSP) nella sua forma di ottimizzazione è NP-Hard.

NP-Complete:

- Sono problemi che sono **sia** in NP che NP-Hard. In altre parole, sono tra i problemi più difficili in NP e se qualcuno trovasse un algoritmo in tempo polinomiale per uno di essi, tutti i problemi in NP potrebbero essere risolti in tempo polinomiale.
- **Esempio**: Il Problema della Satisfacibilità Booleana (SAT) è il primo problema dimostrato essere NP-Complete.

Importanza:

Identificare un problema come NP-Complete implica che, al momento, non esiste un algoritmo conosciuto per risolverlo rapidamente (in tempo polinomiale), e risolverlo potrebbe risolvere anche altri problemi complessi.

Suggested Reading

The Atrocity Archives
(A Laundry Files Novel)
by Charles Stross
Mass Market Paperback (2008)

A Lovecraftian novel, mixing sci-fi with demons, a lost volume of *The Art of Computer Programming*, the Church-Turing conjecture, and all the paranormal activities made possible by $P = NP$...

For **real** nerds.

giovanni.squillero@polito.it Computational Intelligence 5

5

Local search algorithms

- Techniques used to find a better solution by iteratively improving an existing solution
- Useful for solving complex optimization problems where finding an exact solution is computationally expensive
- Paradigmatic example: Gradient Descent
- Caveat
 - We are only interested in the final solution (not the process by which it was obtained)

giovanni.squillero@polito.it Computational Intelligence 7

7

Black box algorithms

- The **problem dynamics are unknown**
 - The "black box" provides output given some input
 - Hypothesis: the Blackbox has no memory
 - The desired output is known, the task is to find the appropriate inputs
 - Constraints may not be explicit

Input → Blackbox → Output

giovanni.squillero@polito.it Computational Intelligence 6

6

Local search algorithms

- Initialization
 - **Generate the current solution** (random, heuristics, ...)
- Main loop
 - **Create neighboring solutions by tweaking** (i.e., making minor adjustments) to the current solution
 - **Replace the current solution** with a neighboring solution
 - Keep **rolling** (iterations)

giovanni.squillero@polito.it Computational Intelligence 8

8

Local search algorithms

- Stochastic Gradient Descent
- Hill Climbing
- Simulated Annealing
- Tabu Search
- Genetic Algorithms
- Particle Swarm Optimization
- Nelder-Mead Simplex
- ...

giovanni.squillero@polito.it

Computational Intelligence

9

9

Example: 8 queens

- Place eight chess queens on an 8×8 chessboard so that no two queens threaten each other
- Pure constraint satisfaction
- Black box
 - Output is 1 when feasible
 - Output is the number of threats (goal 0)

giovanni.squillero@polito.it

Computational Intelligence

11

11

What are we looking for?

- Constraint satisfaction
 - Any viable solution
- Optimization
 - The best solution
- Caveats:
 - Pure CS: minimize the number of constraint violations
 - Usually a mix. A.k.a., "constraint optimization"
 - In most practical cases we are looking for a "reasonable" solution (a.k.a., "approximate optimization")

giovanni.squillero@polito.it

→ greedy

Computational Intelligence

10

10

Example: University timetable

- Enormously big search space
- Timetables must be good
- "Good" is defined by several competing criteria
- Timetables must be feasible
- Vast majority of search space is infeasible

giovanni.squillero@polito.it

Modeling problems

- Given sets of inputs & outputs, find a model that delivers correct output for every known input
 - Supervised ML: classification and regression
 - What-if scenarios
 - Artificial life

giovanni.squillero@polito.it

Computational Intelligence

13

13

Fitness

- The quantitative representation of natural and sexual selection within evolutionary biology
- Individual reproductive success
 - Average contribution to the gene pool of the next generation
 - Can be defined with respect to either a genotype or a phenotype in each environment
- Usually w or ω in population genetics models

giovanni.squillero@polito.it

Computational Intelligence

15

- "Survival of the fittest"** → sopravvive chi lascia + copie di sé
- Coined by Herbert Spencer to describe Charles Darwin's original theory in his *Principles of Biology* (1864)
 - Approved by Darwin himself as an alternative to "natural selection"

giovanni.squillero@polito.it

Computational Intelligence

16

8

7

Fitness landscapes

giovanni.squillero@polito.it

Computational Intelligence

14

14

Problems

- Fitness as reproductive success
 - In Darwinian terms: "Survival of the form that will leave the most copies of itself in successive generations"
 - Survival of the fittest or Survival of the survived?
- Check out Richard Dawkins's discussion in *The Extended Phenotype* (1982)

giovanni.aquillero@polito.it

Computational Intelligence

17

Maximization vs. Minimization

- EA scholars **maximize** the fitness
- OR experts **minimize** the costs
- Economists **maximize** the reward (or value)
- Mathematicians **minimize** functions
- How to define the fitness function $f(x)$ to minimize the result of the evaluation $E(x)$?

giovanni.aquillero@polito.it

Computational Intelligence

19

19

Computer Science

- Fitness $\approx$ Ability to solve the given problem
 - The bigger the better
 - Optimization: "maximize the fitness"
- Often artificial
 - Real value of the solution and arbitrary penalties trying to direct the search into specific directions
- No mention to environment

giovanni.aquillero@polito.it

Computational Intelligence

18

18

Switching Min and Max

- $f(x) = -E(x)$
 - Some algorithms may not work with negative fitness
- $f(x) = K - E(x)$
 - Some algorithms may be impaired by offsets
 - What is the optimal/safe value of K
- $f(x) = \frac{1}{E(x)}$
 - What if $E(x) = 0$?
 - Δf does not reflect ΔE

giovanni.aquillero@polito.it

9/30/24

9/30/24

Fitness landscape

giovanni.aquillero@polito.it

Computational Intelligence

21

21

Global and Local Optima

- The highest peak in the landscape is the global optimum, representing the highest fitness
- Local optima are peaks that are not as high as the global optimum, but still represent relatively high fitness (not really formal, indeed)
- Solutions are attracted by optima (basins of attraction in dynamical systems)

giovanni.aquillero@polito.it

Computational Intelligence

23

23

Fitness Landscapes

- Fitness landscapes can be high-dimensional, but typically are represented in 2 dimensions

giovanni.aquillero@polito.it

Computational Intelligence

22

22

Global and Local Optima

- Unimodal
 - Only **one peak** (easy problem!)
- Multimodal
 - **Several local optima**
- **Isolated Fitness Landscape**
 - Landscapes with a relatively **small number of optima**

giovanni.aquillero@polito.it

Computational Intelligence

24

24

11

12

Valleys

- Valleys are regions of low fitness, they can be deep or shallow, and they can be separated by plateaus or ridges

giovanni.squillero@polito.it

Computational Intelligence

25

25

Ridges

- Ridges are elevated areas that connect different peaks
- Alternative definition: sequences of local optima
- Ridges can provide pathways to explore the landscape, but can also create bottlenecks

giovanni.squillero@polito.it

Computational Intelligence

27

27

Plateaus

- Vast areas of uniformly high fitness
- A.k.a., Mesas, as in "wandering in mesas"

giovanni.squillero@polito.it

Computational Intelligence

26

26

Funnel

- Region where the fitness increases rapidly towards a particular point
- Bottlenecks?

giovanni.squillero@polito.it

Computational Intelligence

Computational Intelligence

32

32

giovanni.aquillero@polito.it Computational Intelligence 33

33

Exploration vs. Exploitation

- Multi-Armed Bandit Problem
 - Multiple levers to pull, each with different payout percentages (average amount of money returned)
 - You don't know which lever has the highest payout
- Exploration
 - Try new levers to see which one works best
- Exploitation
 - Keep pulling the lever with the best payout
- Note: payouts can only be estimated

giovanni.aquillero@polito.it Computational Intelligence 35

35

esplorazione vs sfruttamento

Exploration vs. Exploitation

- The **exploration vs. exploitation dilemma** is a fundamental concept in decision-making
- **Exploration**
 - **Seeking out new information.** Delving into the unknown to discover something new.
- **Exploitation**
 - **Utilizing current knowledge to its fullest potential.** Choosing the best-known option based on existing information to maximize immediate benefits.

9/30/24

Levels in biology

- Fitness: individual's ability to propagate its genes (well, almost)
- Genotype: the genetic constitution of an organism
- Phenotype: the composite of the organism's observable characteristics or traits

Richard Dawkins
The Extended Phenotype: The Long Reach of the Gene
Oxford University Press, 1982 (revised ed. 1999)

giovanni.aquillero@polito.it Computational Intelligence 37

37

Levels (1-max) → es. di ottimizzazione nei processi evolutivi, si prende l con fitness più alta

individual = $I = [0 \ 1 \ 1 \ 0 \ \dots \ 1]$

Genotype Phenotype Fitness

$\sum_{k=0}^n I(k)$ (somma di 1)

giovanni.aquillero@polito.it Computational Intelligence 39

39

Levels in CS (a modest proposal)

- Fitness: how well the candidate solution is able to solve the target problem
- Genotype: the internal representation of the individual, i.e., what is directly manipulated by genetic operators
- Phenotype: the candidate solution that is encoded in the genotype
 - the intermediate form in which the genotype needs to be transformed into for evaluating fitness
 - if genotype can be directly evaluated: genotype and phenotype coincide

giovanni.aquillero@polito.it Computational Intelligence 38

38

Levels (symbolic regression)

$f(x) = (0.2 - \frac{x}{42}) \cdot \ln(x)$

Fitness = $\int_{x=0}^x |f(x) - g(x)|$

Genotype Phenotype Fitness

giovanni.aquillero@polito.it Computational Intelligence 40

40

esprime la qualità della soluzione

19

20

Discussion

- Fitness: Objective evaluation + some vague ideas about how to find a solutions (hints)
- How to evaluate a partial/incomplete solution?
- How to evaluate a non-working solution?
- Fitter is better, but is ΔF meaningful?

giovanni.squillero@polito.it

Computational Intelligence

41

41

Betrand Russel

The greatest challenge to any thinker is stating the problem in a way that will allow a solution

giovanni.squillero@polito.it

Computational Intelligence

43

43

Discussion

- What is a "neighboring solution" in local search?
- "Genetic proximity" depends on the algorithms used (i.e., operators available):
Is "STRESSED" close to "DESSERTS"?
 - Yes, if we have an "invert" operator
 - No, if we change character by character
- What about "DYSTOPIA" and "EAGER"?
 - Pretty close, if the gene is an index over dictionary entries

giovanni.squillero@polito.it

Computational Intelligence

42

42

Alternative terminology

- Modeling as "switching search spaces"
- Modeling is going "from the problem space to the fitness landscape"
- Genotypes are "mapped" to phenotypes
- The phenotype "is" the fitness (!?)

giovanni.squillero@polito.it

Computational Intelligence

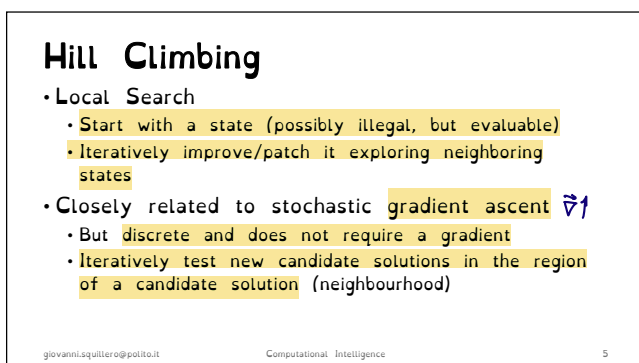

44

TEST PROBLEMS

1-Max

giovanni.squillero@polito.it

Computational Intelligence

9

One Max

- **Goal**
 - Build a string of ones (or an array of all True, etc.)
- **Fitness**
 - Sum of the ones
- **Very easy task:**
 - Unimodal
 - Separable
 - Non deceptive
 - ...

giovanni.squillero@polito.it

Computational Intelligence

11

One Max

- Simplest possible test problem
- The basic form and its variants are still among the most used benchmarks in the EC / soft-computing world

giovanni.squillero@polito.it

Computational Intelligence

10

Variant: Two Max

- The goal is to maximize $\max(\#0, \#1)$
 - Where $\#1$ is number of 1's (traditional 1-max), and $\#0$ is the number of 0's
- Useful to see when an algorithm chooses (arbitrarily) to maximize the number of 1's or of 0's

giovanni.squillero@polito.it

Computational Intelligence

12

5

6

Even more variants

- Noisy 1-max
 - White noise is added to the evaluation of the fitness
- Dynamic 1-max
 - The optimal solution changes over time
- Weighted 1-max
 - Positions in the binary string have different weights
- Multi-objective 1-max
 - Optimizing multiple objectives simultaneously

giovanni.squillero@polito.it

Computational Intelligence

13

TEST PROBLEMS

Knapsack(s)

giovanni.squillero@polito.it

Computational Intelligence

15

giovanni.squillero@polito.it

Computational Intelligence

14

"Classical" Knapsack problem

- One of the best-known integer programming problems
- Given a set of items, each with a weight and a value, determine the number of each item to include in a collection so that the total weight is less than or equal to a given limit and the total value is as large as possible

giovanni.squillero@polito.it

Computational Intelligence

16

Variants

- **Multidimensional Knapsack Problem**
 - Handle more than one constraint, e.g., both volume limit and weight limit
 - A.k.a., Multiple-constrained Knapsack Problem
- **Multiobjective Knapsack Problem**
 - Target different, possibly conflicting goals, e.g., cost and sentimental value

giovanni.squillero@polito.it

Computational Intelligence

17

Knapsack problems

- **Multidimensional Knapsack problem**
 - Handle more than one constraint, e.g., both volume limit and weight limit
 - A.k.a., Multiple-constrained Knapsack Problem
- **Multiobjective Knapsack problem**
 - Target different, possibly conflicting goals, e.g., cost and sentimental value

giovanni.squillero@polito.it

Computational Intelligence

19

Knapsack problems

- **0-1 Knapsack problem**
 - Determine determine which items to include in the collection
- **Multiple Knapsack problem**
 - Optimize more than one collections

giovanni.squillero@polito.it

Computational Intelligence

18

Hill Climbing 0-1/multidim Knapsack

```
solution = np.full(NUM_ITEMS, False)

while True:
    new_solution = solution.copy()
    index = np.random.randint(0, NUM_ITEMS)
    new_solution[index] = not new_solution[index]
    if value(new_solution) > value(solution):
        solution = new_solution
```

giovanni.squillero@polito.it

Computational Intelligence

20

giovanni.squillero@polito.it

Computational Intelligence

21

giovanni.squillero@polito.it

Computational Intelligence

23

Tweaks = *variazioni della soluzione*

- Use larger sample (directly favor exploitation)
- Occasionally makes larger, more random changes (directly favor exploration)
- Accept worsening changes hoping to escape local optima (see *simulated annealing*)
- Restart from scratch from a state (always a good idea, if you have spare time)

giovanni.squillero@polito.it

Computational Intelligence

22

Simulated Annealing

giovanni.squillero@polito.it

Computational Intelligence

24

Simulated Annealing

- Formalized around 1980s (Kirkpatrick, et al.)
 - ... but embryonic ideas date back to 1950s (Metropolis, Rosenbluth, Rosenbluth, Teller, Teller)

- Basic idea: Hill Climbing with $p \neq 0$ of accepting a worsening solution s' where $f(s) > f(s')$:

$$p = e^{-\frac{f(s) - f(s')}{t}}$$

- Where: s is the current solution, s' is the tweaked one, and t is the temperature

to avoid to stop at local optimum

giovanni.squillero@polito.it

Computational Intelligence

25

Simulated Annealing (alt)

giovanni.squillero@polito.it

Computational Intelligence

27

p = probability to accept this sol

Simulated Annealing

- Schedule: the rate at which t is decreased
 - Longer schedule $\rightarrow$ more random walk (more exploration)

giovanni.squillero@polito.it

Computational Intelligence

26

Tabu search

giovanni.squillero@polito.it

Computational Intelligence

28

recent moves prohibited

Tabu Search

- Tabu, from Tongan **tapu**: inviolable, forbidden
 - Commonly spelled taboo in both AmE and BrE
- Usually a variation on SAHC w/Replacement:
 - Generate n new solutions, but discard the tabu ones

```

tmp = [tweak(solution) for _ in range(NUM_SAMPLES)]
candidates = [sol for sol in tmp if is_valid(sol) and sol not in tabu_list]
if not candidates:
    continue
  
```

- Only works in discrete spaces!

giovanni.squillero@polito.it

Computational Intelligence

29

Iterated Local Search

- A cleverer version of Hill-Climbing with **Random Restarts**
 - The process restart from the point selected by **new_starting_position(global, last)**
 - Almost "black magic", but simply returning the best solution found so far usually works

```

def new_starting_position(global_, last):
    if global_ is None:
        return np.random.random((NUM_SETS,)) < .5
    else:
        return global_
  
```

giovanni.squillero@polito.it

Computational Intelligence

Computational Intelligence

30

Set cover

giovanni.squillero@polito.it

Computational Intelligence

32

Set Cover

- Given a family of sets, find the subfamily of minimum cost that covers all elements in the universe
- Several possible greedy algorithms

giovanni.aquillaro@polito.it

Computational Intelligence

33

33

Set Cover

- Classical testbench in combinatorics, computer science, operations research, and complexity theory
- One of Karp's 21 problems shown to be NP-complete in 1972

giovanni.aquillaro@polito.it

Computational Intelligence

34

34

- Hill Climbing:** Un algoritmo semplice ma potente per la ricerca locale, con diverse varianti e condizioni di terminazione.
- One Max:** Un problema di test semplice che serve come base per comprendere le dinamiche degli algoritmi di ottimizzazione.
- Knapsack Problems:** Problemi combinatori complessi con molteplici varianti, utili per testare algoritmi di ottimizzazione in scenari reali.
- Simulated Annealing:** Un algoritmo di ottimizzazione robusto che bilancia esplorazione e sfruttamento, evitando gli ottimi locali.
- Tabu Search:** Un metodo avanzato che utilizza una memoria di soluzioni proibite per migliorare l'esplorazione dello spazio delle soluzioni.
- Iterated Local Search:** Un miglioramento di Hill Climbing che utilizza ripartenze per esplorare diverse regioni dello spazio delle soluzioni.
- Set Cover:** Un problema combinatorio NP-completo con applicazioni in vari campi, utile per valutare la potenza degli algoritmi di ottimizzazione.

10/7/24

Parameter optimization

- The solution is a list of real numbers (i.e., floating point)
- Technically not Hill Climbers, but "Evolution Strategies" → for continuous space
- (1+1)-ES, (1+λ)-ES, (1,λ)-ES

giovanni.aquillaro@polito.it

Computational Intelligence

37

37

(1+1)-ES

- A first-improvement Hill Climber were
 - tweak(.) is performed using a Gaussian mutation on each element
That is: $x_i' = x_i + N(0, \sigma)$
- Normal distribution $N(\xi, \sigma)$
 - $\xi = 0$
 - σ is called "mutation step"

giovanni.aquillaro@polito.it

Computational Intelligence

38

38

Lab 1

35

Summary of classical problems of computational intelligence

Continuous search spaces

giovanni.aquillaro@polito.it

Computational Intelligence

36

36

Dati di Partenza:

- Universe: {1, 2, 3, 4, 5}
- Set disponibili:
 - {1, 2}
 - {2, 3}
 - {4}
 - {5}
 - {1, 5}

Tabella del Comportamento dell'Algoritmo:

Set Selezionati	Numero di Set	Percentuale di Copertura	Miglioramento
{2, 3, {4}, {5}}	3	80% (4 su 5 coperti)	No, manca l'elemento 1
{2, 3, {4}, {5}}	3	80% (4 su 5 coperti)	No, manca l'elemento 1
{2, 3, {4}, {1, 5}}	3	100% (5 su 5 coperti)	Sì, copertura completa

Descrizione dei Passi:

- Passo 1:** Partiamo con i set {1, 2}, {4}, {5}. Questa combinazione copre gli elementi {1, 2, 4, 5}, ma lascia scoperto l'elemento 3. Copriamo quindi l'80% dell'universo.
- Passo 2:** Sostituiamo il set {1, 2} con {2, 3}, ottenendo la copertura degli elementi {2, 3, 4, 5}. L'elemento 1 rimane scoperto, quindi la percentuale di copertura rimane all'80%, e non si osserva un miglioramento rispetto alla soluzione precedente.
- Passo 3:** Sostituiamo il set {5} con {1, 5}. Ora i set selezionati sono {2, 3, 1, 5}.

10/7/24

(1+λ)-ES

- A steepest-step Hill Climber were
 - λ is the sample size
 - tweak(.) is performed using a Gaussian mutation as in (1,1)-ES
- In ES slang: the plus strategy

giovanni.aquillaro@polito.it

Computational Intelligence

39

39

(1,λ)-ES

- A steepest-step Hill Climber were
 - λ is the sample size
 - tweak(.) is performed using a Gaussian mutation as in (1,1)-ES
 - The current solutions is always replaced, even if all the new λ solutions are worsening
- In ES slang: the comma strategy
- Caveat: using large λ reduces the risks to stop in local optimum

giovanni.aquillaro@polito.it

Computational Intelligence

40

40

Strong Causality

giovanni.squillero@polito.it

Computational Intelligence

41

41

Evolution Strategies

- Normal distribution $N(\xi, \sigma)$, but how to select the best mutation step σ ? $\rightarrow$ goals
- Random guess
- Experience
- Meta-optimization

giovanni.squillero@polito.it

Computational Intelligence

43

Weak Causality

giovanni.squillero@polito.it

Computational Intelligence

42

42

Dynamic Strategy

- Monitor the number of successes over a given amount of steps (called an *era* in evolutionary jargon)
- Tweak σ to balance exploration and exploitation
 - Endogenous parameter
 - Problem-space vs. algorithm space

giovanni.squillero@polito.it

Computational Intelligence

10/7/24

1/5 success rule

- Let r_s be the ratio of successful mutations
- Reset σ after every k iterations
- Traditional values
 - $\sigma = \sigma/c$ if $r_s > 1/5 \rightarrow$ reduce
 - $\sigma = \sigma \cdot c$ if $r_s < 1/5 \rightarrow$ increase
 - $\sigma = \sigma$ if $r_s = 1/5 \rightarrow$ unchanged
- With $0.8 \leq c \leq 1$

giovanni.squillero@polito.it

Computational Intelligence

45

Self-adaptation $\rightarrow$ how to add dynamic behavior

- Self-adaptive strategy II
 - Add a σ for each $v \in \{v_1, \dots, v_n, \sigma_1, \dots, \sigma_n\}$
- Mutate σ and v as before...
- Two learning rates
 - Global learning rate τ'
 - Coordinate-wise learning rate τ'

giovanni.squillero@polito.it

Computational Intelligence

47

47

Self-adaptation

- Adaptation vs. Self-adaptation
- Self-adaptive strategy
 - Add σ to the list of parameters $\langle v_1, \dots, v_n, \sigma \rangle$
- Mutate σ and v in different steps
 - Learning rate: $\tau \propto \frac{1}{\sqrt{n}}$
 - $\sigma' = \sigma \cdot e^{\tau \cdot N(0,1)}$
 - $v'_i = N(v_i, \sigma')$
- Always mutate first σ then v_i !?

giovanni.squillero@polito.it

Computational Intelligence

46

Self-adaptation

- Self-adaptive strategy III
 - $\langle v_1, \dots, v_n, \sigma_1, \dots, \sigma_n, \alpha_1, \dots, \alpha_k \rangle$ ($k = \frac{n(n-1)}{2}$)
- Covariance Matrix C :
 - $c_{ii} = \sigma_i^2$
 - $c_{ij} = 0$ if i and j are uncorrelated
 - $c_{ij} = \frac{1}{2} \cdot (\sigma_i^2 - \sigma_j^2) \cdot \tan(2 \alpha_{ij})$ when correlated
