

- tree search (informed, not informed)
- state vs node
- graph vs tree
- local search
- es
- genetic algorithm
- diversity
- minimax
- reinforcement learning
- difference path, solution, policy search
- diversity
- minimax and ways to optimize it
- differences between node and state
- differences between tree search and graph search
- tabu search and simulated annealing
- similarities between path search and EA
- informed vs uninformed strategies
- greedy best first vs dijkstra
- differences between node, state and frontier
- (bonus) exploration vs exploitation in all the algorithms
- Talk about ES and what are the components to make it different from other algorithms (Ans: talk about population, tweak, genetic operators, offspring and fitness func)
- Difference between crossover and mutation
- What are the modality to end a GA
- what is steady state
- how we can detect steady state
- is fitness better than genotype to recognize a steady state?
- genotype as proxy in diversity
- difference between uninformed and informed path search
- Swarm strategy
- ES
- difference between A* and Dijkstra
- ES vs EP
- A* vs Greedy best first
- simulated annealing, how better and worse solutions are evaluated
- diversity in evolutionary computation
- how to use fitness for diversity (penalty for similar solutions in fitness functions, multi-objective evolutionary algorithms)
